INTELLIGENCE  
FOR EVERYONE**

## Unlock the Power of Security Intelligence **With One Click**

Having access to lots of security data — alerts, vulnerability scan data, suspicious files — is great, but how do you know where to take action first? That's where security intelligence comes in. The Recorded Future browser extension makes security intelligence accessible from any web browser, whether you're in your SIEM, your email security portal, your vulnerability scanner, or even your email. With a single click, the browser extension surfaces real-time risk scores and arms you with the intelligence you need to quickly prioritize the items that need your immediate attention.

1

# Triage Alerts at Lightning Speed

Almost half of the alerts security teams receive go uninvestigated. There's simply too much for already short-staffed security teams to do with the time they have. So, how can you get through more alerts faster? Layer security intelligence over your SIEM, and in seconds you will see the alerts that pose the highest risk. Click on an IOC to find the context behind why something is high risk.

**Triage Faster and Respond More Effectively With  
Recorded Future**

44%

of security alerts

go uninvestigated

## Laser Focus on Vulnerabilities That Matter

Vulnerability management and patching continues to be a growing pain for companies. As digital footprints expand and vulnerabilities increase, it's impossible to tackle every vulnerability in your organization. So, which ones really need your attention? Security intelligence provides outside context about which vulnerabilities are currently or soon-to-be exploited, so you can easily prioritize the ones that represent a real risk. The best part? You can access all of this intelligence directly on top of your vulnerability scan.

**Prioritize Patching With Real-Time Exploit Data From  
Security Intelligence**

**17k** known  
security  
vulnerabilities

were  
catalogued

## How Bad Is This File?

What's in that mystery file? Initial investigations often rely on file reputation services to analyze unknown files. To identify truly malicious files, however, you need rapid context and enrichment on the indicators to aid response and accelerate remediation. Use Recorded Future's browser extension to speed up your malware analysis and verdicts by instantly gaining access to intelligence on associated IOCs.

**Get the Full Picture Fast With Real-Time Context From Recorded Future**

The average cost of a malware attack on a company is

**\$2.4 million**

# Security Intelligence Is Better Than Speed Reading

Researching threats takes a lot of time. Between threat feeds, blogs, and the multitude of other intelligence sources like US-CERT, security researchers need to parse a lot of information to be confident in their decisions. Recorded Future's browser extension empowers you to unleash the power of security intelligence on any security text, so you can instantly identify and organize the pertinent information around hashes, IPs, domains, and vulnerabilities.

**Exponentially Increase Your Consumption of  
Security Information With Security Intelligence**

On average,  
a person can  
only read

50-75  
words

of technical  
material  
per minute
