

Exposure Management

Actively discover, prioritize and respond to exposures across your digital attack surface

Problem

Digital transformation initiatives have resulted in assets being scattered across the internet. Often created without proper security oversight or hygiene, many internet-facing assets are left forgotten and unsecured.

This results in security teams operating with limited visibility into their attack surface, causing delayed responses to critical vulnerabilities, a backlog of exposures to remediate, and an unclear picture of what needs to be prioritized.

76%

of organizations say they've experienced a cyberattack that started with the exploit of an unknown, unmanaged, or mismanaged internet-facing asset. Source: ESG

Exposures along your attack surface present adversaries with an easy target.

As organizations continue to embrace the benefits of digital transformation and take advantage of cloud-based resources, visibility and context are required to ensure internet-facing assets are secured.

Solution

Recorded Future's Attack Surface Protection Solution provides the same view an adversary sees from outside the network and gives defenders insight on which assets could be at risk. Using Recorded Future as part of a defensive strategy makes it possible to identify and inventory internet-facing assets, prioritize remediation efforts such as vulnerability patching, and accelerate the remediation of high-risk exposures.

Drivers

Digital transformation

M&A events

Business growth

Challenges

Unknown assets

Vulnerable applications

Cloud misconfigurations

Threat Intelligence Outcomes

Real-time discovery

Prioritized exposures & risks to address

Proactive mitigation and faster incident response

Benefits

Improve Asset Discovery

Eliminate visibility gaps with automated and continuous discovery of external assets, a real-time inventory, and valuable context for further investigation.

Prioritize Exposures

Detect high risk CVEs, misconfigurations, and additional types of exposed assets. Dynamic exposure scoring and evidence are provided to prioritize remediation efforts.

Accelerate Remediation Efforts

Actionable context helps simplify workflows, enabling the accelerated mitigation of threats. Reduce risk with automated playbooks, ticket generation, and alerting on new vulnerabilities before they're published in the NVD.

The screenshot displays the Recorded Future interface. At the top, there's a search bar and a navigation menu with icons for home, alerts, charts, search, lists, reports, users, and settings. The main content area shows a summary for 'Exposures' with 33 exposures found. A prominent 'CRITICAL' badge shows '1' exposure. A 'Vulnerability' card for CVE-2023-27997 is highlighted, showing a score of 89 and '4 Insikt Group Notes'. Below this, a 'Top Risk Rule' is listed: 'NIST Severity: Critical' with '9 of 23 Risk Rules Triggered'. A table lists several exposures with their severity levels: Critical (Detect unpatched (CVE-2023-27997) FortiOS VPN Interface), Moderate (Vulnerable Versions of MySQL), Moderate (Symfony Profiler - Detect), Moderate (ElasticSearch - Default Password), Moderate (Webalizer Log Analyzer Configuration - Detect), and Moderate (Test CGI Script - Detect). At the bottom, there are links for 'See Current Exposures' and 'See Exposure History'.

Client Success Stories

A large publicly-traded software company uses Recorded Future to continuously find unknown assets. By surfacing subdomains the company lacks insight into, they're able to determine site legitimacy and quickly take the appropriate action, whether that's decommissioning the site or adding to their asset logs for future scanning.

Increase visibility

90% of clients have a better understanding of their threat landscape now by using Recorded Future

Identify unknown threats

48% faster at identifying new threats prior to using Recorded Future

Understand your digital footprint

85% of clients have a better understanding of their digital footprint now by using Recorded Future
